

## ABSTRACT

The present invention relates to one or more patterns (particularly camouflage patterns), to any article comprising one or more of such patterns, and to business methods relating thereto. Such patterns comprise one or more images of any animal or part thereof and may comprise other images such as plant images. In a preferred aspect, the animal is an insect such as a flying insect including a moth or butterfly. Articles, people and/or animals that are covered in all or part by the camouflage patterns of the invention are more difficult to detect (for example by sight) than those articles, people and/or animals not comprising such camouflage pattern. Thus, the invention is useful in hunting and military applications where concealment is important.
